

International Strategic and Operational Management of Used Nuclear Fuel

Waste Management Symposia – 2015 Conference – Panel Session 126

Thursday March 19th, 2015

*Frederic Bailly
VP Operational Integration & Strategic Development
Back-End Business Group
AREVA, Inc.*

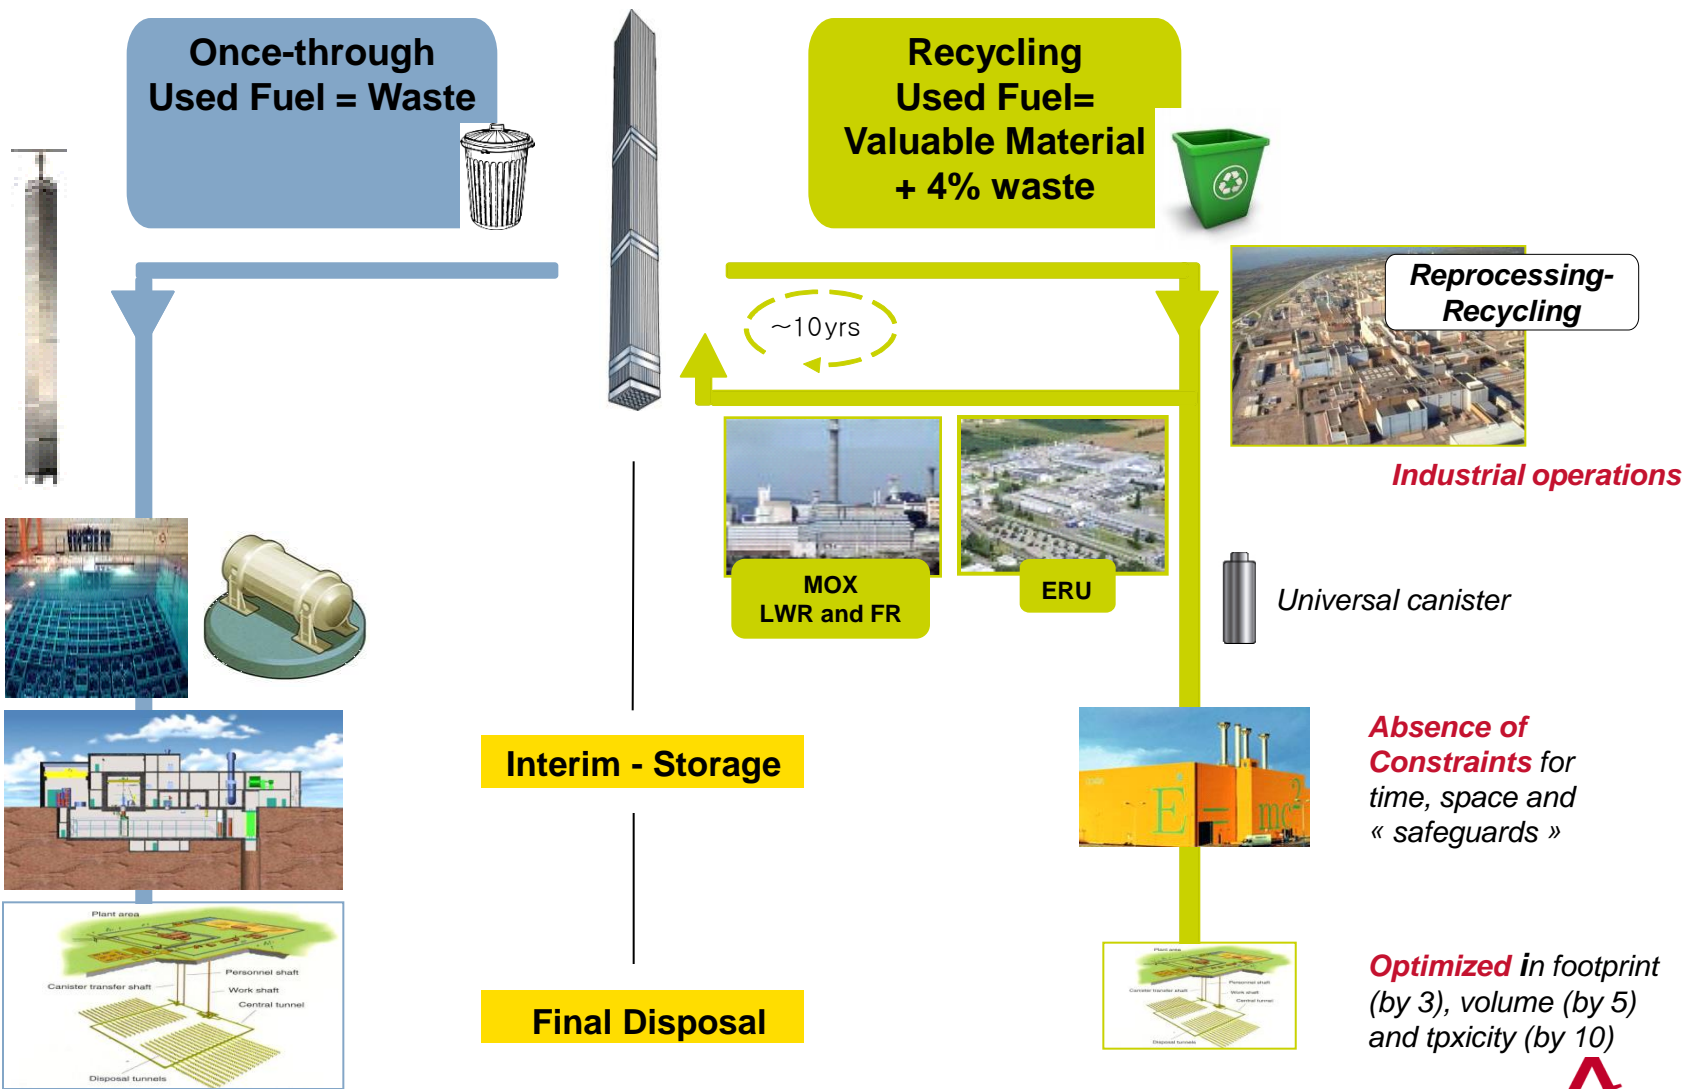

Two Main Options for Used Fuel Management Over Time

Once-through
Used Fuel = Waste

Recycling
Used Fuel =
Valuable Material
+ 4% waste

Constraints for
time, space, and
safeguards

Reconditioning for
transport
Encapsulation
Under development

Technical and
economical
uncertainties

**Reprocessing-
Recycling**

Industrial operations

Universal canister

**Absence of
Constraints** for
time, space and
« safeguards »

Optimized in footprint
(by 3), volume (by 5)
and toxicity (by 10)

Global nuclear capacity is expected to increase significantly by 2030

LWR Used Fuel Inventories

LWR Used Fuel Annual Unloading

► Deep geological repository will remain a scarce resource

Reduce direct costs + risks related costs & increase value generated

The French Nuclear Fuel Cycle

Uranium mining and concentration
~ 8000 t/year

Conversion

Enrichment
~ 5.5 MUTS/year

Fuel fabrication

25 500 tons

Natural Uranium Savings

Reprocessed Uranium (RU)

Plutonium

58 NPPs
22 with MOX
4 with REPU
430 TWhe /year

~120 t/y MOX

ERU

ENU

~1050 t/y

Fuel Assemblies

Very low, low and intermediate level waste

Near Surface Disposal

18 940 tons

Interim Storage savings

Reprocessing

UC-V
UC-C

Geological Disposal

Spent fuel 1200 t/y

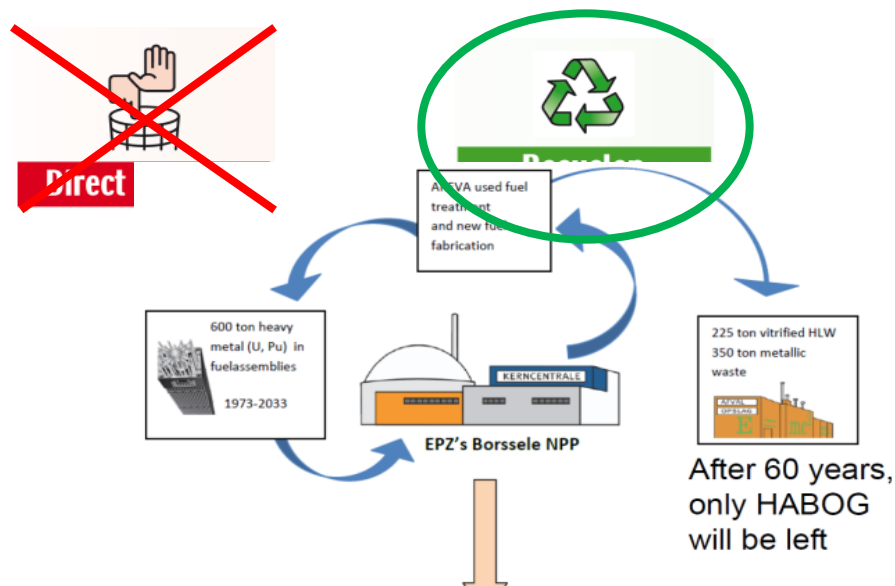

The Netherlands or how to close the fuel cycle with a single reactor?

► Netherlands

- ◆ 17 M people, 110 TWh annual production
- ◆ 1 reactor 500 MW representing 3,5 %
- ◆ Policy : 100 years above-ground storage
- ◆ 1 Facility : HABOG operated by COVRA

► In 2006, Government and EPZ agreed to operate Borssele until 2034.

- ◆ Two back-end options considered

Historical nuclear utilities are facing major challenges

Used Fuel Management

- ▶ Significant inventories
- ▶ Scarcity of (or major delay in developing) final disposal path

- ▶ Industrial interim systems not always capable of bridging the gap
- ▶ Uncertainty over used fuels LT behavior

Reactors' life extension

Reactors' shut-down

New reactors

Main issues

- ▶ Saturation of reactors pools and constraints on operations
- ▶ Safety demonstration

- ▶ Pool unloading for phase out
- ▶ Damaged fuels

- ▶ Difficulty to get new license

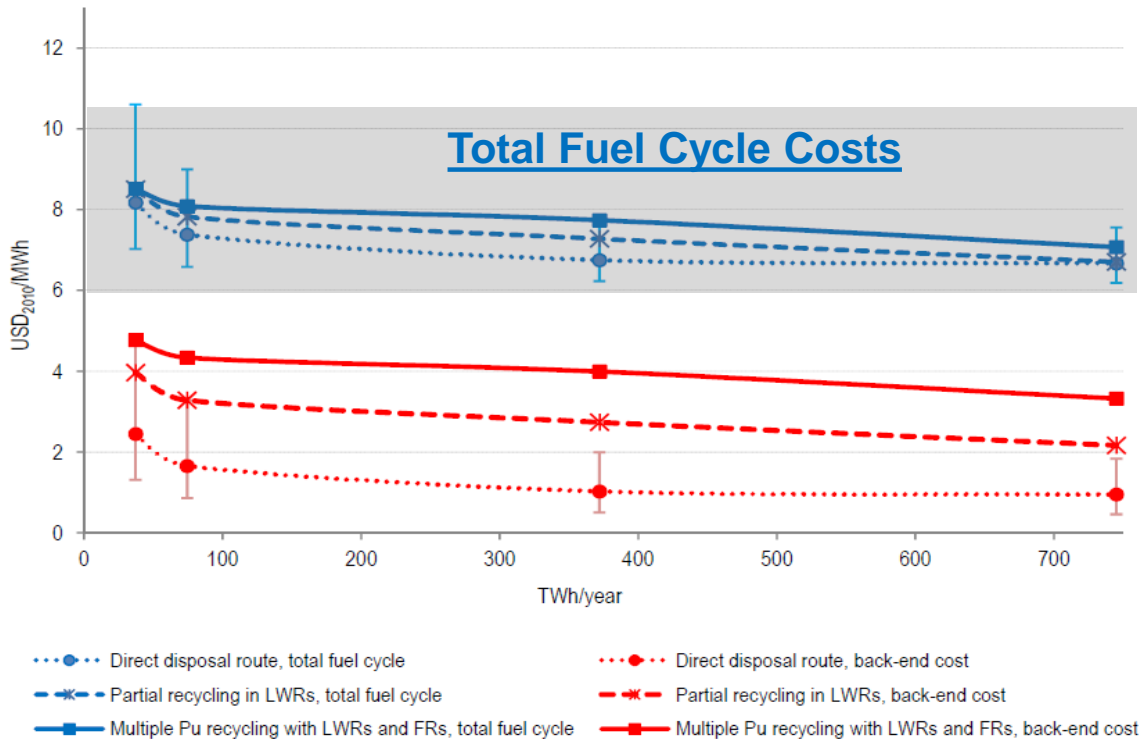

Increased attractiveness of options allowing for safety, security and long term risk reduction

Closed Fuel Cycle: Economically Robust

OECD report on Cycle Economics 2013

Figure ES.1: Total fuel cycle and back-end levelised costs for different reactor fleets and strategies, 3% discount rate*

3 scenarios over 60 years

Direct disposal

LWR recycling

LWR and FR recycling

Main quantified Benefits

▣ *FE Savings from ERU and MOX use*

▣ *Savings from HLW disposal over 60 y*

Main findings

Total Fuel Cycle Costs are comparable in the 3 scenarios

A number of risks and benefits are mentioned and NOT quantified

Some benefits are missing

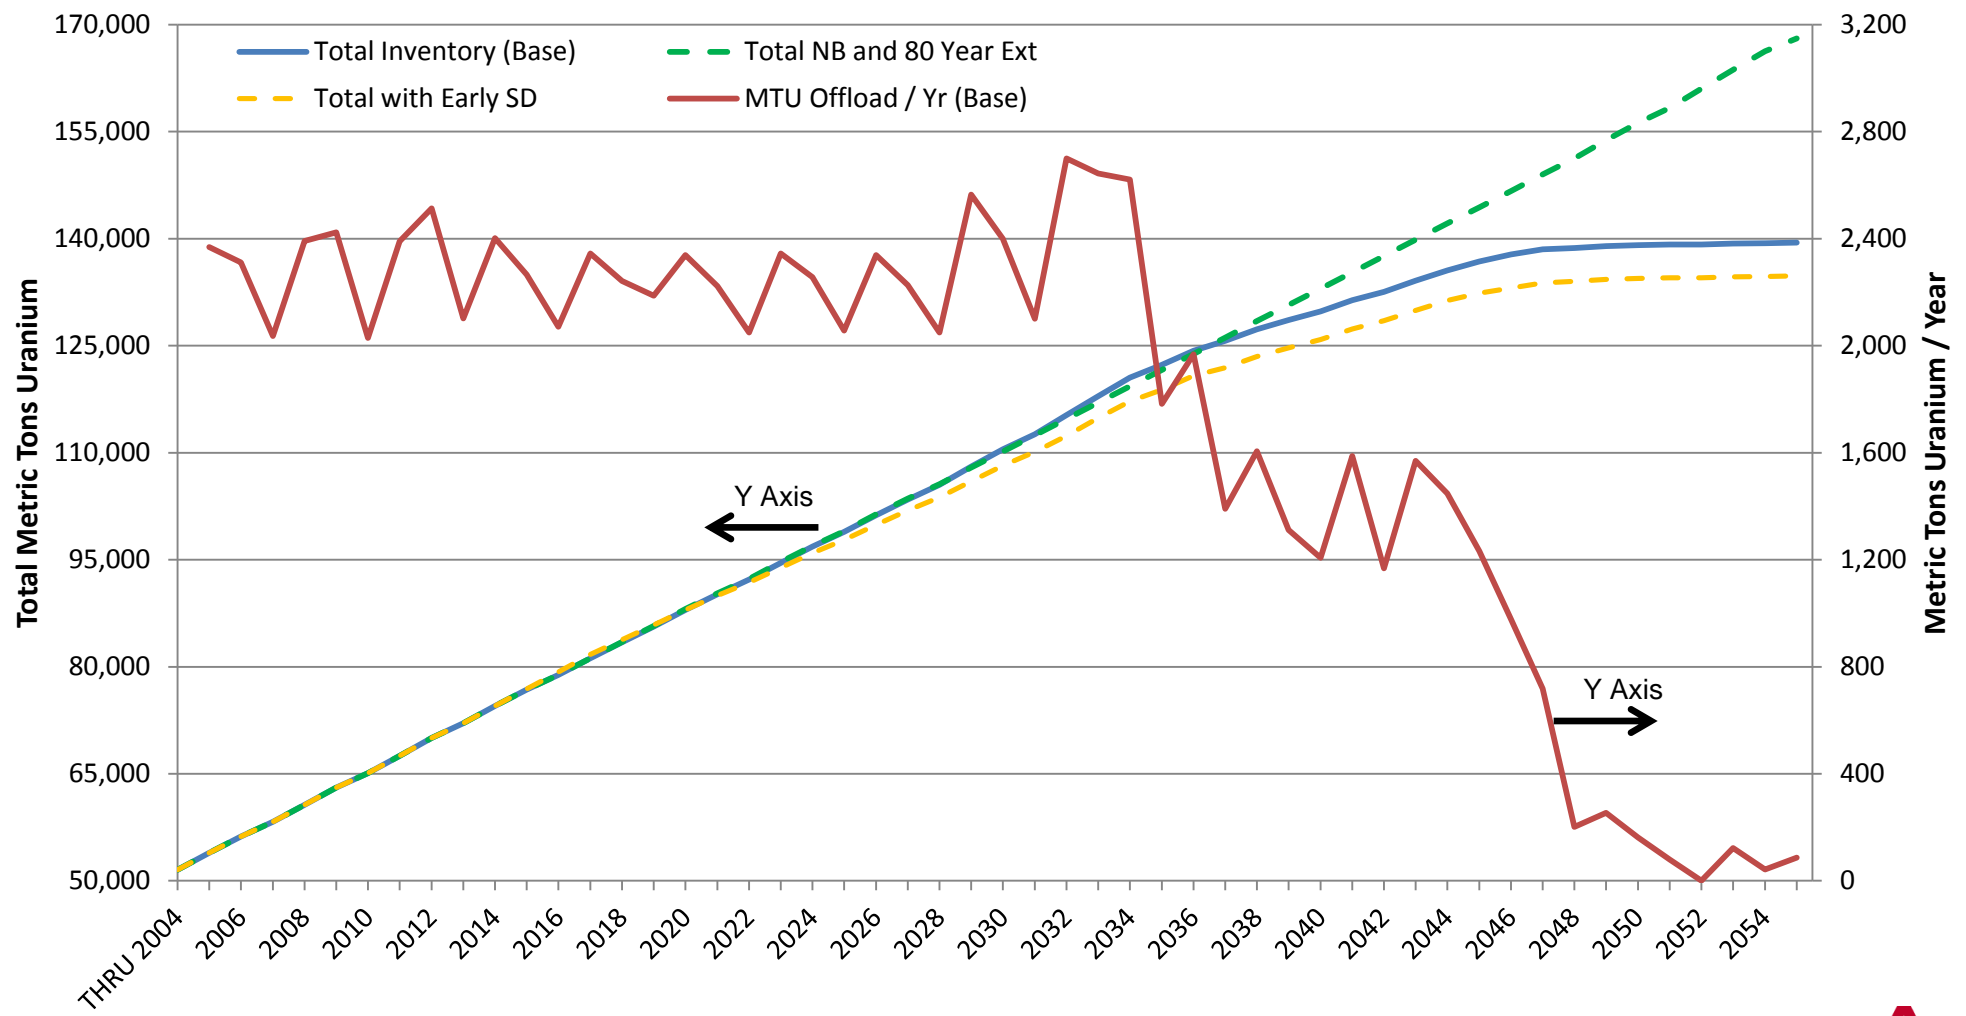

Similar cost of fuel cycles without taking into account significant recycling benefits

Base Case = All operating plants go to full plant life of 60 years
 Early SD = Base minus units in the shutdown scenario
 NB and 80 Year = All operating NPPs go to 80 years and 5 new units being built

U.S. Used Nuclear Fuel Inventory Outlook

A Unique Situation, opening for Unique Solutions

Source: NEI / Gutherman Technical Services

Comprehensiveness and flexibility of chosen solutions are key

- ▶ Paths for countries considering interim storage must encounter:
 - ◆ Potential delay for centralized storage,
 - ◆ Public / regulatory pressure for emptying Used Fuel pools before saturation, as a safety measure,
 - ◆ difficulty with inter-site transport of Used Fuel (public/regulatory pressure)

Storage systems need to be compatible with transport and all possible schemes of used fuel management

Dry Storage of Used Fuel from “commodity” to « Critical System »

What will this look like in **150 years?**

New Solutions & Business Models

Aging Management

Installed Base:

- ◆ Development of tools guaranteeing the integrity of welds

New Systems

- ◆ New Material for better resistance to corrosion
- ◆ External and Internal Monitoring Sensors

Building, together, Sustainable Cycle Solutions

RECYCLING & HLW STORAGE

RECYCLING

INTERIM OPTIONS FOR USED FUEL
